The six adapted items: current and updated wording

The current wording is taken from v21, as it is now. The updated wording is the fix adapted to that text, with v21's citation numbers in brackets. Citations stay on the same words; numbers may shift by one or two when the batch renumbers. Not applied yet.

1. Exhibit 1, Aladdin Provider row (page 3)

"They" could mean clients or the providers.

NOW (V21) Gives custodians and administrators access to Aladdin, and they pay BlackRock for it [25]

UPDATED Gives custodians and administrators access to Aladdin. The custodians and administrators pay BlackRock for it [25]

---

2. Exhibit 2 note (page 3)

IBOR, ABOR and NAV are never spelled out. Page 3 is full, so the labels stay short and one line goes in the note.

NOW (V21) Step labels: "Position in the IBOR", "Lot in the ABOR", "NAV". The note has no definitions.

UPDATED Labels unchanged. Add to the note: "IBOR is the investment book of record. ABOR is the accounting book of record. NAV is net asset value."

---

3. Exhibit 14 source list (page 12)

The pull-request numbers sit next to their citation numbers, so they read as one doubled number.

NOW (V21) … the Copilot page [23], pull requests 52 and 53 [53, 54], the SDK README [29], the public specifications [6], …

UPDATED … the Copilot page [23], two SDK pull requests [53, 54], the SDK README [29], Aladdin's public API specifications [6], …

---

4. Exhibit 16, "Get help" row, Receipt cell (page 13)

The same problem: "Pull request 52" is followed by a superscript, which reads as a typo.

NOW (V21) Pull request 52 [53], pull request 57 [88], Studio page [14], APIs page [30]

UPDATED SDK change for enterprise gateways [53], SDK change for Pydantic v2 [88], Studio page [14], APIs page [30]

---

5. SDK paragraph under Exhibit 16 (page 13)

It lists three details but never says what they show. “A prompted password” is unclear, and “consume” is jargon.

NOW (V21)

The SDK is the one piece of Studio a prospect can install before any conversation. Its README documents three run modes: “a developer’s local machine,” “Aladdin Studio Compute sessions” and a test mode. It stores a prompted password in the operating system’s credential manager. It carries settings for firms that consume “the Aladdin APIs via an enterprise API management platform such as Azure API Management” [29].

UPDATED

The SDK is the one piece of Studio a prospect can install before any conversation. Its README shows it is built for firms with strict IT controls. It runs in three modes: “a developer’s local machine,” “Aladdin Studio Compute sessions” and a test mode. When it asks the user for a password, it keeps it in the operating system’s credential manager. It has settings for firms that call “the Aladdin APIs via an enterprise API management platform such as Azure API Management” [29].

---

6. About this document, paragraph 1 (page 15)

“The sources are” reads as a complete list, then more types follow. “The rest are” is vague, and some recordings include speakers from outside BlackRock.

NOW (V21)

The sources are BlackRock product pages, investor presentations, SEC filings, a fund prospectus, procurement notices, press releases and job postings. They also include public code and packages on GitHub and PyPI, other vendors’ product and developer pages, blogs and trade press. The rest are transcripts of recordings and earnings calls with BlackRock speakers.

UPDATED

The sources include BlackRock product pages, investor presentations, SEC filings, a fund prospectus, procurement notices, press releases and job postings. They also include public code and packages on GitHub and PyPI, other vendors’ product and developer pages, blogs and trade press. Finally, they include transcripts of recordings and earnings calls in which BlackRock speakers take part.
