Exhibits 3 and 4: what six experts found

Six experts each tried to break page 4 from a different angle, quoting the repo's sources for every objection: a former Studio product manager, a platform architect, a developer relations lead, a buy-side CTO, an equity analyst and an information designer. A separate agent verified the suggested sources for facts the document leaves uncited. Check only: the document is unchanged.

What breaks it

Four problems. Most experts found the first one independently.

Exhibit 3 stacks BlackRock's apps and Copilot on top of Studio 5 of 6 experts

The layers say BlackRock's apps reach Aladdin through Studio, and that client builders work through BlackRock's apps. The sources say the apps and Studio sit side by side on the same services. Rosales says the domain teams "own all of the services that serve trading data to all Aladdin applications". Exhibit 14 on page 12 already draws them as parallel columns.

Fix. Put BlackRock's apps with Copilot and Studio side by side on the shared-services band. Put "Who builds" over Studio only, and show the client's own environment, as Exhibit 14 does.

"AWS option, announced, not live" contradicts BlackRock's 10-K Analyst; confirmed in the filing

The FY2025 10-K, already cited in the document, says "the Aladdin infrastructure and environment for BlackRock and its external Aladdin clients are hosted on Microsoft Azure and Amazon Web Services." The AWS release also says eFront products already run on AWS.

Fix. Show hosting as "Microsoft Azure and Amazon Web Services". Note that general availability for US Aladdin Enterprise clients was set for the second half of 2026. Drop "not live" and the hatching.

The controls column claims more than the sources support CTO, architect, designer, devrel

It runs beside every row, from BlackRock's apps down to hosting, so it reads as covering everything a client builds. Each control is narrower. OAuth scopes are one of several sign-in options, and basic auth and client keys carry no scope. Compliance runs by default on posting an order only, and the caller can switch it off. The dataset "second check" is a review state that BlackRock-internal endpoints use, and other endpoints register datasets straight into release. Data Cloud, storage and the Data eXchange have their own access paths.

Fix. Run the column beside the shared-services band only, state each control's real scope, and drop or requalify the dataset second check. The same wording sits in Exhibit 14 on page 12 and on page 5, so fix it there too.

Exhibit 4 pushes the Excel tools and the Data eXchange into a footer Insider (breaks it); devrel, analyst, designer

BlackRock's APIs, ATX and ADX pages list them under "Additional Aladdin Studio resources", beside Data Cloud and Aladdin Compute. Exhibit 4 gives the SDK and the portal full tiles but not these two. Exhibit 3 also treats Excel users as a builder group.

Fix. Make them two tiles inside the Studio frame, citing BlackRock's "Additional Aladdin Studio resources" list.

What weakens it

Data Cloud and the Data eXchange are drawn as ways in, not out Insider, CTO, architect

BlackRock sells both mainly for getting Aladdin data out: Data Cloud “pushes that into Snowflake” and is shared to clients’ own Snowflake accounts, and ADX offers 40+ standard extracts. Data Cloud is reached by SQL, not through the 11 API domains.

Fix. Draw Data Cloud as a second path out of the core to the client, with SQL access.

---

eFront, Aladdin Wealth and Preqin are missing from Exhibit 3 Insider, analyst

Part 1 and Exhibit 1 define Aladdin as these plus the Aladdin platform, and eFront and Preqin data flow into Data Cloud. Exhibit 3 also lists Preqin-like data as an outside vendor input.

Fix. Name them in the shared-services band or as a line under it.

The shared-services band’s label is loose Architect, CTO

“Risk” is not one of the 11 domains, and the risk APIs are governance (rules, exceptions). The platform domain holds identity and Studio’s own Data Cloud admin API, so part of Studio sits below Studio. The 54 public specifications are a subset of the “dozens” clients get.

Fix. Label the band with the functions, and say the 11 domains are the public part of the API set.

Exhibit 4’s two groups describe the same things twice Designer, insider, devrel

Studio Compute and Aladdin Compute read as two products, though they are one. API tokens go with the APIs and the ADC Admin Center with Data Cloud, but nothing shows the pairing. The workspace panel sits outside the yellow Studio frame, so it reads as not part of Studio. “OAuth applications” and “API applications” name one thing twice.

Fix. Put the workspace panel inside the frame and tie each item to its tile, for example “Studio Compute: where Aladdin Compute runs your code”. Use one name for applications.

Aladdin Graph and events are split, and the SDK is undersold Devrel

BlackRock’s Aladdin Graph posting says Graph is the firm-wide runtime “for APIs and events”, serving BlackRock and 200+ institutions, so a separate events tile and Graph inside Studio both mislead. The SDK tile omits the typed API clients and the Data Cloud client.

Fix. Describe the APIs tile as built on Aladdin Graph, BlackRock’s runtime for APIs and events. SDK tile: “typed clients for the APIs and Data Cloud, with login, retries and rate limits”.

Governance is missing from “What Studio is made of” Insider

BlackRock’s Studio page sells “data, tools, and governance support”, and the Risk pages say “governance frameworks” and “access management and usage monitoring”.

Fix. Add governance as a line or tile, quoting the Studio page.

Colours and line styles mean different things on page 4 and page 12 Designer

Hatching means “announced” on page 4 but “not in the public record” on page 12. Pink marks only Copilot on page 4 but all of BlackRock’s own use on page 12. Dashes mean both “not live” and “outside Aladdin”.

Fix. Use one key for both pages.

What holds up

- BlackRock’s own phrase “shared services and data”, from the Studio page, backs the shared band.

- About 100 apps, Copilot in all of them, and each tool mapping to a production API are word for word from Rosales.
- Data Cloud inside Studio is backed three ways: Newman, the Studio page and BlackRock’s resource list.
- “Event-driven workflows” is BlackRock’s own phrase, from the Aladdin Risk page and a job posting.
- The four builder groups, the 11 packages, every spec id starting agraph.<domain>, and every item in the workspace list check out.

Found outside page 4

The 54 specifications are not visible “only by unpacking” the packages Devrel

The plugin-builder README on GitHub links every spec. The claim appears in Exhibit 16 and elsewhere.

Fix. Say the specs ship inside the packages and are linked from the plugin builder’s README.

The AWS release is dated December 5, 2025, in Sources Analyst, verifier

Amazon’s copy is dated December 1, 2025.

Fix. Check the date and correct the entry.

Uncited facts: sources verified

254 uncited facts checked across the document. 241 have a source nearby, in an exhibit note, earlier, or are the author’s own count or inference. For the other 13, an independent agent opened each suggested source:

Backs

core SDK adds four utility APIs (source code entry); eFront bought in 2019 (eFront release, and the webinar already cited); trademark notice (Studio page footer); dataset 4-eyes review state (specifications).

Partly

bitemporal fields (risk exceptions have two time fields, but datasets only have a flag); “trading desk, then operations” (operations backed by the webinar, not the spec); “a user sees only what their entitlements allow” (permissions per operation, not what a user sees); “Azure today” (true for Aladdin, but eFront already runs on AWS); “providers a Studio buyer compares” (only Snowflake and Databricks, and only for RFPs in general).

Does not back

“Investment team” at the position step (the sources say portfolio management, trading and operations); Clearwater’s marketplace score (the cited release has no marketplace, but cwan.com/platform/partners does); the order alpha, beta, stable, sunset (no BlackRock source defines it).
